

REC boosts sustainability credentials as two panels receive Environmental Product Declarations (EPD)

Australia, July 4, 2022 – [REC Group](#), an international pioneering solar energy company headquartered in Norway, is pleased to announce that the company has received Environmental Product Declarations (EPD) from EPD Norway for the [REC Alpha Pure](#) and [TwinPeak 4](#) solar panels. Both products were released just last year. The EPDs provide independently verified confirmation of REC's continued commitment with every product generation to reducing the environmental impact of solar panels.

EPD: what is it?

The international EPD system is a global program for environmental declarations. Each declaration summarises the environmental impact of all components of a finished product, production process and transport. Being independently verified, EPDs provide stakeholders in the solar industry with a valuable source of data for objective comparisons. They also serve as confirmation of the low carbon footprint (LCF) of solar panels.

Innovation for sustainability: new products gain EPDs

Jan Enno Bicker, CEO at REC Group says: “At REC, we believe that as the solar industry grows in importance, so does our responsibility to be more sustainable. Today’s customers understand that while going solar is doing good, how much good can vary greatly. As such, REC constantly renews its product portfolio in order to increase power while being cautious about the consumed resources. Both products that have gained EPDs were launched last year, testifying to the success of REC’s continuing efforts to make its own production and the entire solar industry more sustainable, and to rise to the challenge of LCF design and production.”

The REC TwinPeak 4 gained its EPD on the basis of the solar-grade silicon manufactured by REC in Norway using REC’s unique kerf upcycling. With this technology, REC can convert kerf, waste material of the wafer production process, to high-quality solar grade silicon, drastically reducing carbon emissions by up to 96% compared to the standard Siemens process¹. Silicon production is the most energy-intensive step in manufacturing solar panels, so improvements make a major difference.

¹ https://en.wikipedia.org/wiki/Polycrystalline_silicon

EPDs take into account a specific entire supply chain for a product. In the case of REC Alpha Pure, the EPD is based on polysilicon coming from Germany, cells and modules being manufactured in Singapore and installation done in Europe for example. Another reason why the REC Alpha Pure is more sustainable, is because of the eliminated lead content, making the solar panel also RoHS compliant. The issue: even today, a solar panel typically contains a small amount of lead in relation to its total weight. On a large scale, the impact by the solar industry can be significant, particularly when solar panels are recycled at the end of their service life.

Growing demand for sustainability

After 25 years in the industry, REC is seeing growing demand from the market for more sustainability along the entire solar value chain, from production to end of life. Given that REC's products have a lifetime of 25 years and more, it is essential to take a long-term view. EPDs, which take into account the entire supply chain for the product, not just the manufacturer's own processes, provide decision makers with guidance on long-term sustainability. They are also increasingly becoming a gateway requirement for project developers to bid for deals.

About REC Group:

REC Group is an international pioneering solar energy company dedicated to empowering consumers with clean, affordable solar power through high-quality solar panels with a leading power density. As Solar's Most Trusted, REC is known for its patented innovations and multiple award-winning products with reliable long-term performance. The cornerstone for REC's strong reliability is advanced and highly efficient manufacturing using Industry 4.0 practices. Founded in 1996 in Norway, REC has always been committed to a low carbon footprint in its solar materials and panels. REC is headquartered in Norway with operational headquarters in Singapore and regional hubs in North America, Europe, and Asia-Pacific.
